BUILD ENVIRONMENT

KEY ARCHITECTURAL DECISIONS

Three-environment deployment

Local · Staging · Production. Independent DBs, Twilio numbers, Gmail accounts, API keys. Shadow team in staging means every loop can be tested end-to-end without touching real recipients.

Three-tier authority model

Tier A: agent acts autonomously. Tier B: agent drafts, Selmen approves. Tier C: Selmen-only (meetings, hire/fire, signing). Per-account email tier rules. Personal account permanently locked to draft-only at the code level.

Five interlocking loops

Capture (1) feeds Dispatch (2) feeds Chase (3). Briefing (4) surfaces state. Learning (5) compounds value over time. Each loop is independently feature-flagged so misbehavior is contained without redeploy.

Tiered Claude usage

Sonnet 4.6 for high-volume routine work (capture parse, brief drafting, classification, nudge generation). Opus 4.7 for reasoning-heavy work (project planning, weekly insights, monthly strategy). Cost balanced.

Single source of truth: Postgres

All state in one DB. Drizzle ORM gives type safety. Backups daily. Soft deletes preserve history. No data shared with the broader Takeovers Unified Platform — full security boundary isolation.

Default-OFF feature rollout

Code ships with capabilities disabled. Flags flipped one at a time in production with 48+ hours between flips. If anything misbehaves, flag goes OFF in seconds. No emergency redeploys, no waking up at 2 AM.
